Digital Photography and the Cell Phone Era

As digital photography became more popular, we saw the introduction of camera phones. What used to be a device that was used solely for audio communications became a quick on the go way to take photographs. The ability of cell phones to take photographs meant that people didn't have to worry about carrying a camera everywhere they went. Though the pictures you take on a cell phone are not usually of the same quality as those you take with a standalone digital camera, it is certainly far

better than missing a shot because you forgot the camera or because you didn't think it would be needed.

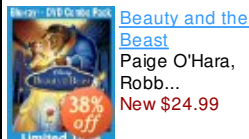

The thing to remember about digital photography on a cell phone is the quality is not going to match that of a standalone digital camera. Of course, different phones will offer different quality. Just like some cell phones have very high musical quality but low quality cameras, the same holds true in reverse. You have to look at the camera phone you are considering and determine if it has the quality you seek. You also want to remember that not every camera phone has flash capabilities, so unless you do not anticipate using your camera phone to take pictures anywhere but outdoors during the daylight hours, you want to make sure you purchase a phone that includes a flash.

With the digital photography that is available on cell phones there is no need to worry about missing an important event though in most cases the capabilities of cell phone cameras are limited when compared to an ordinary digital camera. That doesn't mean that they are inferior products as such but rather that their capabilities are limited. It would be rather difficult to have a combination product with perfect features in every respect—there must be one feature that is better than the other. The basic concept of a cell phone is for audio communication thus anything beyond that is going to have limited capabilities.

The choice you make when you buy a cell phone is a personal one based on your immediate needs. You do want to keep in mind that each model has specific capabilities that you must consider before you make the purchase. If you are looking for a cell phone with high quality digital photography capabilities, you will have to pay more for it.

Fuji Digital Cameras Under \$200

October 7, 2010

fuji digital cameras under \$200

what is the best camera to get under 200 bucks?

I desperately need a new camera!! I had a little digital fuji that I loved but it finally wore out and with 3 active little girls, I need the camera-lol

I don't want something overly complicated or fancy-just one of those "point and shoot" kind of deals. I've tried out the Fuji finepix at target and I like it but my sister in law just let me borrow her canon and I liked it too (it was a digital 7.1 megapixel and took great pics)

I would like something that also has automatic face recognition along with several enviroment adjusting options (dark,snow,action,etc). I will mostly be using it for plays,birthdays,cheer competitions,family trips,etc.

so which camera would be best?

Canon SD780is would be your best choice.SD780IS12.1 MP Digital Camera with 3x Optical Image Stabilized Zoom and 2.5-inch LCD.Good picture quality and also

Nikon Lens Hoods

October 7, 2010

nikon lens hoods

Do i need to buy a lens hood for Nikon 55-200MM lens?

I getting the nikon vr 55-200mm lens i know it comes with the hood but do i need to buy a diff one liket he flower shape one?

often on long-range lenses (which the 200mm approaches), the cut-hood (the “flower” one) can actually create shadowing/silhouetting on the image. I’d stick with the hood it came with if/when you find the need for one.
